The Theory Of Jacobi Forms (Progress In Mathematics)

Synopsis

The functions studied in this monograph are a cross between elliptic functions and modular forms in one variable. Specifically, we define a Jacobi form on $SL(2, \mathbb{Z})$ to be a holomorphic function ϕ on the upper half-plane satisfying the transformation equations $\phi\left(\frac{cT+d}{aT+b}\right) = (cT+d)^{-k} \phi(T)$ (1) $\phi(T, z+h+j) = e^{2\pi i j} \phi(T, z)$ (2) and having a Fourier expansion of the form $\phi(T, z) = \sum_{n \geq 0} c(n, r) e^{2\pi i n T + 2\pi i r z}$ (3) $c(n, r) = 0$ for $n < 0$ or $r \neq n/4$. Here k and m are natural numbers, called the weight and index of ϕ , respectively. Note that the function $\phi(T, 0)$ is an ordinary modular form of weight k , while for fixed T the function $z \mapsto \phi(-r, z)$ is a function of the type normally used to embed the elliptic curve $y^2 = 4x^3 - g_2x - g_3$ into a projective space. If $m = 0$, then ϕ is independent of z and the definition reduces to the usual notion of modular forms in one variable. We give three other examples of situations where functions satisfying (1)-(3) arise classically: 1. Theta series. Let Q be a positive definite integer valued quadratic form and B the associated bilinear form.

Book Information

Series: Progress in Mathematics (Book 55)

Paperback: 150 pages

Publisher: Birkhäuser; 1985 edition (September 14, 2013)

Language: English

ISBN-10: 1468491644

ISBN-13: 978-1468491647

Product Dimensions: 7 x 0.3 x 10 inches

Shipping Weight: 8 ounces (View shipping rates and policies)
