Numerical Methods For Fluid Dynamics: With Applications To Geophysics (Texts In Applied Mathematics)

Synopsis

This scholarly text provides an introduction to the numerical methods used to model partial differential equations, with focus on atmospheric and oceanic flows. The book covers both the essentials of building a numerical model and the more sophisticated techniques that are now available. Finite difference methods, spectral methods, finite element method, flux-corrected methods and TVC schemes are all discussed. Throughout, the author keeps to a middle ground between the theorem-proof formalism of a mathematical text and the highly empirical approach found in some engineering publications. The book establishes a concrete link between theory and practice using an extensive range of test problems to illustrate the theoretically derived properties of various methods. From the reviews: "...the books unquestionable advantage is the clarity and simplicity in presenting virtually all basic ideas and methods of numerical analysis currently actively used in geophysical fluid dynamics." *Physics of Atmosphere and Ocean*

Book Information

Series: Texts in Applied Mathematics (Book 32)

Hardcover: 516 pages

Publisher: Springer; 2nd ed. 2010 edition (September 23, 2010)

Language: English

ISBN-10: 1441964118

ISBN-13: 978-1441964113

Product Dimensions: 6.1 x 1.1 x 9.2 inches

Shipping Weight: 2 pounds (View shipping rates and policies)

Average Customer Review: 5.0 out of 5 starsÂ Â See all reviewsÂ (1 customer review)

Customer Reviews

An excellent text. One of the clearer discussions within geophysical flows of the numerical techniques for problem solving. The material on semi-implicit timestepping was particularly useful. Previously, I've only found this in Canuto et al 2006 (Spectral Methods, Volumes 1 & 2), and this text by Durran is significantly more approachable.
